

INTEGRITY TREE IMAGING

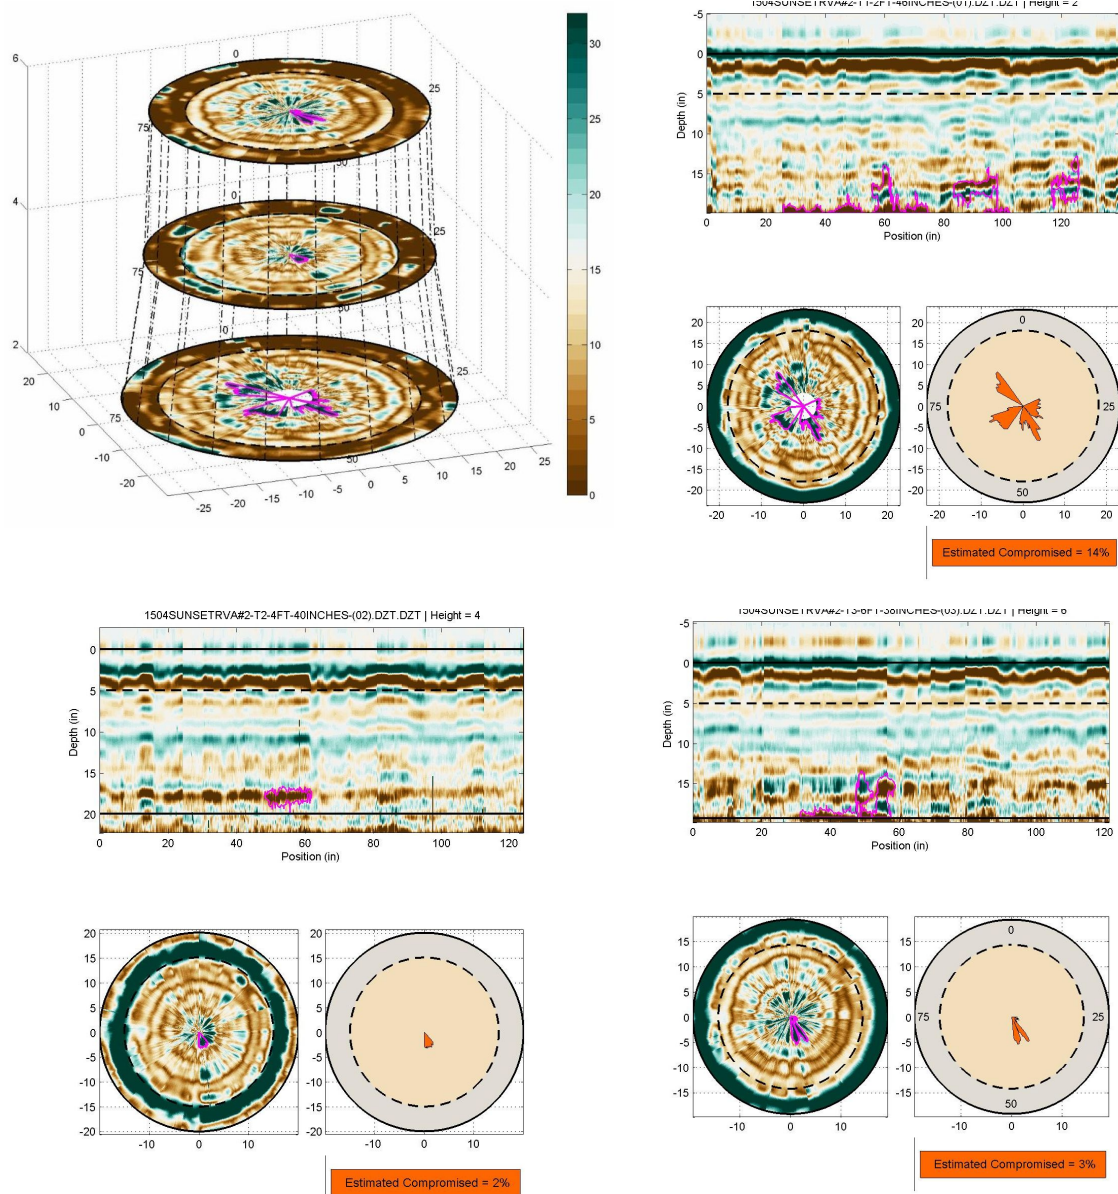

See your tree from the inside out.

Perfection ... So It Seems

It is a distinct pleasure to view this 40-inch diameter Willow Oak (*Quercus phellos*) tree. Located in a quiet neighborhood in one of the historical cities of our nation, the regal surroundings allow a person to imagine the beauty and enjoyment it has provided to decades of residents. At first glimpse, the three virtual saw cut images, pictured below, show an extraordinarily sound and decay-free trunk that is in great condition for a tree of this size and age. However, the next set of subsurface images tell a different story and are a

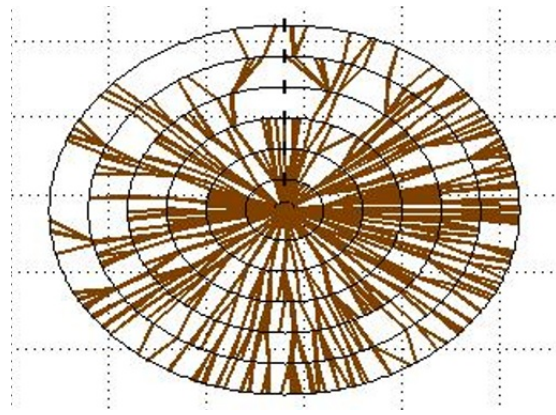

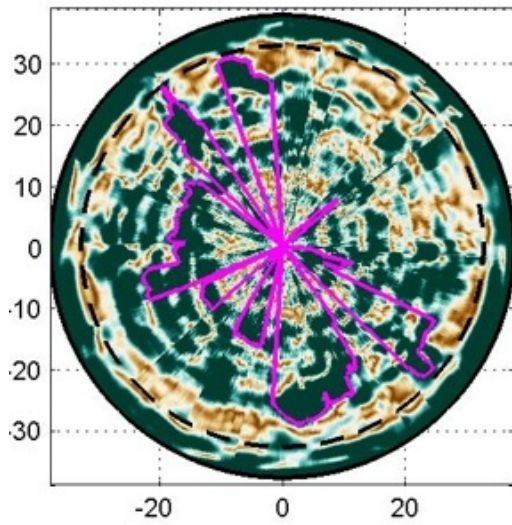

surprise compared to what has been previously observed.

Early Detection of Decline

The results from the root and root crown scans were completely unexpected. The root crown/collar pictured below on the left, while not indicative of a hollow cavity, does indicate decline (dark green) from the softwood that reduces overall wood strength. The bottom right root scan image indicates root loss on the top left area of the scan. Early detection of an unobservable problem is a great advantage of advanced analysis provided by Integrity Tree Imaging. Only radar imaging can look at the roots and root crown so that the appropriate action can be taken for the good of people, the tree, and property.

Don't Be Surprised

There is nothing more powerful than seeing and knowing the dynamics happening inside your trees right now! Be proactive rather than reactive to the easily observed external indicators of tree health decline. It is usually too late to turn the health of your tree around when you start seeing external signs of problems. ITI provides you with the current condition of the most critical areas your valuable trees. Click the button below and let us help you make the hard decisions easier as you care for your trees and the people around them.
